

Feature Request:

Remove Added Tracks from Search Results

24th August 2026

Objective

Search results should not display tracks that are already in the playlist and therefore cannot be interacted with.

Background

The results section currently offers no distinction between tracks that have been added to the playlist and those that have not. Added tracks are neither dimmed nor do they have their action buttons removed. As a result, tracks that cannot be interacted with are presented as though they can be. These non-interactive tracks not only clutter the results panel but also mislead users into clicking on them.

This feature aims to improve the user experience by displaying only tracks that *can* be added to the playlist in the search results.

Technical design

App.js

The **handleAddTrack** method will be updated to remove the track being added from the **searchResults** state. The track will be filtered out using the **trackId**.

The **handleSearch** method will be updated to remove all tracks in the playlist from the results before updating the **searchResults** state.

Caveats

Another solution to this problem would be to remove the action buttons from tracks in the results pane that are already in the playlist. The added tracks could also be dimmed as a clearer visual cue.
